

Nicole Wozniak – Project 1 – ITWP 1150

Functionality of this application is to provide a dice roller for four types of dice. A d4 (1-4), d6 (1-6), d10 (1-10) and d20 (1-20). Each have their own individual squares that when you click on them it updates a new number value that is randomized.

When you first load the page it will look like the following, each roll defaulted to 0.

Within the squares with the green border, clicking the black section will roll the dice. When you click on this button the 0's will update to a random number for that dice. Here is a screenshot of what it looks like with each one rolled:
